LIST OF TABLES

Table 1.1 Environment Requirement	6
--	----------

1. Overview

1.1 Features

In the case of V.1.2.0 BSP, following drivers/libraries/utilities are supported:

- 1) Startup
- 2) ARM timer
- 3) Mailbox
- 4) Serial driver
- 5) SD driver
- 6) Display driver
- 7) USB driver
- 8) Network driver
- 9) I2C driver
- 10) GPIO driver
- 11) i2c_test, gpio_test, spi_test utilities

1.2 Scope

This document scope applies to the evaluation of reproducing QNX6.6.0 image and testing QNX BSP drivers for Raspberry Pi2 platform.

1.3 Target System

- 1) Target platform: Raspberry Pi2 platform.
- 2) Target software: QNX SDP 6.6.0

1.4 List of Abbreviations and Acronym

Abbreviation	Full Form
BSP	Board Support Package
Mailbox	BCM2836 Mail box
SDP	Software Development Platform - A software is used to build BSP
Momentics IDE	QNX Momentics Integrated Development Environment

1.5 Environmental Requirement

Table 1.1 Environment Requirement

Equipment	Explanation
Windows Host PC	Windows 7 or higher
Terminal software	TeraTerm (version 4.75 or newer)

2. Building QNX6.6.0 OS image

2.1 Prerequisites

1) QNX6.6.0 SDP installed on Windows Host PC.

2) QNX6.6.0 BSP for Raspberry Pi2 board project folder

Download bsp-ntotrunk-broadcom-bcm2836-trunk.zip and extract it into a folder on Windows Host PC (ex: C:\bsp-ntotrunk-broadcom-bcm2836-trunk)

3) Valid active key (bcm2836.build)

Replace (overwrite) valid active key (bcm2836.build) onto bsp-ntotrunk-broadcom-bcm2836-trunk\prebuilt\armle-v7\boot\build\bcm2836.build

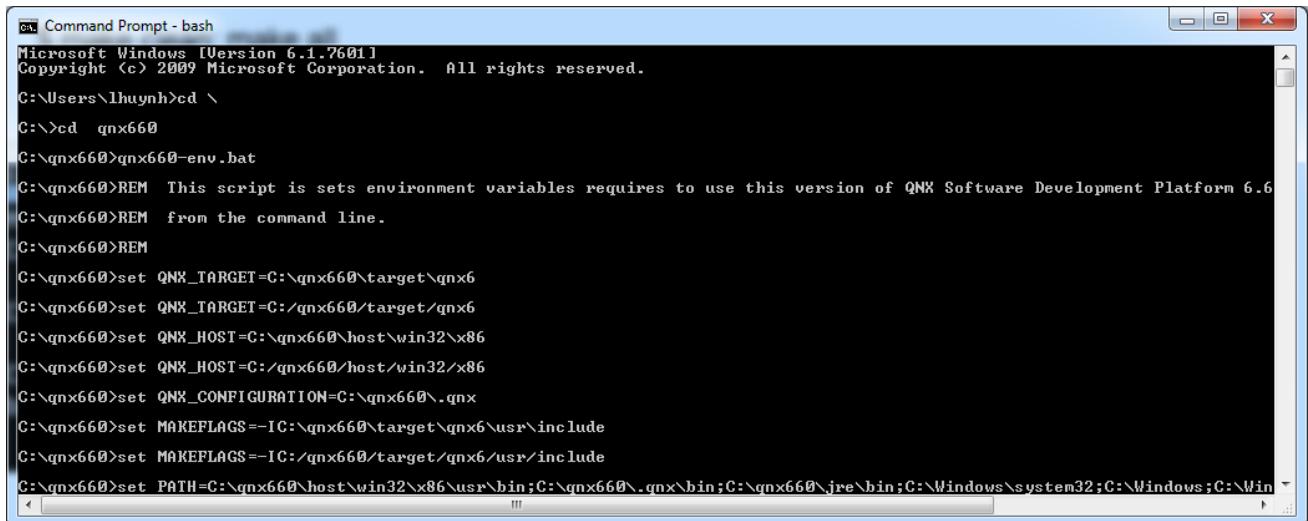

A valid active key is not required to build QNX6.6 image from bsp-ntotrunk-broadcom-bcm2836-trunk.zip, but you can't successfully boot QNX6.6 with an invalid active key.

To obtain a valid active please get your Raspberry Pi2 board's serial number and send this serial number to SHC.

2.2 Build QNX 6.6.0 BSP

To generate the QNX image for Raspberry Pi2 board, enter following commands from the command prompt console:

```
$ cd QNX 6.6.0 install
$ qnx660-env.bat
$ cd <QNX_BSP_Root_Directory>
$ bash
$ make clean; make all
```

```
Command Prompt - bash

```

QNX 6.6.0 image is created at: bsp-ntotrunk-broadcom-bcm2836-trunk/images/ifs-bcm2836.bin

3. Boot up QNX 6.6.0

3.1 Prerequisites

- A SD Card which the first partition is formatted as FAT32.
- ifs-bcm2836.bin: a QNX 6.6 image for Raspberry Pi2 board, which is built by a valid active key as guide in 2.2 section Build QNX 6.6.0 BSP.
- SD_boot_binaries.zip which is patched in the release package.
- Tera Term software installed on Windows PC.

3.2 Boot up steps

Please follow the steps:

3.2.1 Step 1: Copy the necessary files to SD card.

- Put file ifs-bcm2836.bin which located at bsp-ntotrunk-broadcom-bcm2836-trunk/images/ifs-bcm2836.bin to the root folder of the SD card.
- Extract files in SD_boot_binaries.zip to the root folder of the SD card. After this step, in the root folder of SD card should have these following files:
 - config.txt
 - bootcode.bin
 - start.elf
 - start_cd.elf
 - start_db.elf
 - start_x.elf
 - fixup.dat
 - fixup_cd.dat
 - fixup_db.dat
 - fixup_x.dat
 - ifs-bcm2836.bin

3.2.2 Step 2: Insert SD to Raspberry Pi2 board

Insert SD card which has the necessary files into SD slot of Raspberry P2 board.

3.2.3 Step 3: Connect serial port of Raspberry Pi2 to Window PC

Please use TTL-232R-3V3 (<http://www.ftdichip.com/Products/Cables/USBTTLSerial.htm>) to connect Raspberry Pi2 board to Window PC as following:

GND:	TTL-232R-3V3 pin1 (Black)	<----->	RPi2 J8 pin 6
Rx :	TTL-232R-3V3 pin5 (Yellow)	<----->	RPi2 J8 pin 8
Tx :	TTL-232R-3V3 pin4 (Orange)	<----->	RPi2 J8 pin 10

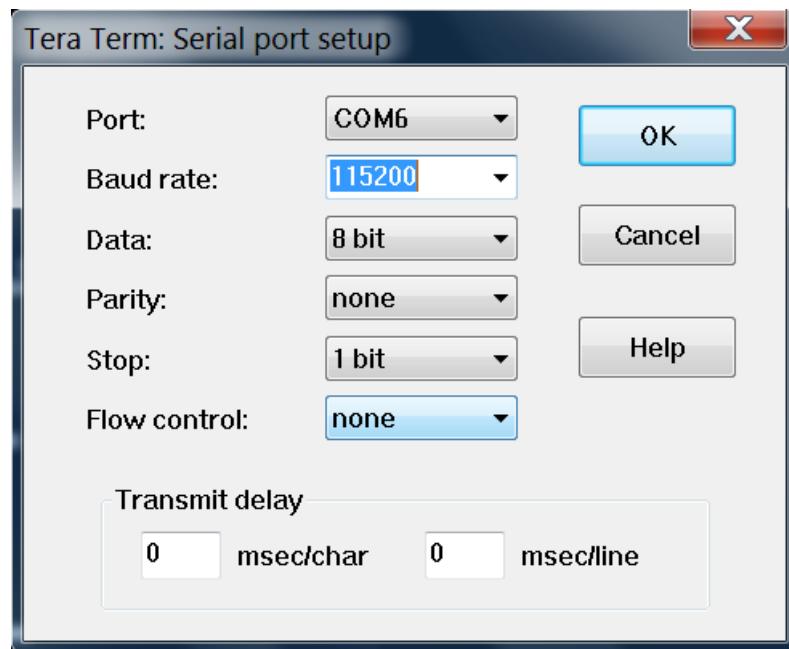

Please note: you must use the TTL-232R-3V3 version. The version TTL-232R-5V could damage your Raspberry Pi GPIO because of 5V logic.

3.2.4 Step 4: Connect HDMI LCD to Raspberry Pi2 board

3.2.5 Step 5: Setup serial port for Window PC

From Window PC open Tera Term program and set up as following:

3.2.6 Step 6: Power up Raspberry Pi2 board

Raspberry Pi2 board is powered up by plug the board to an USB power source. You could power it by your PC USB port if it could supply more than 800mA.

3.2.7 Step 7: Image QNX 6.6.0 will be loaded

Image will be loaded and the [Tera Term] terminal will output as bellows:

```

```

3.2.8 Step 8: Boot up finish.

Boot up is finished with prompt “RPi2#” and user could enter command from this prompt.

4. Test driver

4.1 Serial driver

Make sure can type some commands.

4.2 USB driver

Notes: Mouse isn't supported yet and driver cannot detect device insert/remove

- 1) Plug in USB device to USB port (Upper or Lower) of Raspberry board.
- 2) Make sure io-usb and devb-umas is running as below.

```
# io-usb -d rpi ioport=0x3f980000,irq=73
# devb-umass cam pnp
```

- 3) From Terminal console, run below commands

```
# mount -tdos /dev/hdXtY /usb_flash      (Replace hdXtY with the actual USB
device node created in /dev/)

# cp -v /usb_flash/file_name /tmp          (Copy data from USB)

# cp -v /tmp/filename /usb_flash/          (Copy data to USB)
```

4.3 Network driver

4.3.1 Test Overview

Connect the Raspberry Pi2 board and Windows PC via a hub by using LAN cables. Make sure that data is sent and received between PC and the Raspberry Pi2 board through Ethernet.

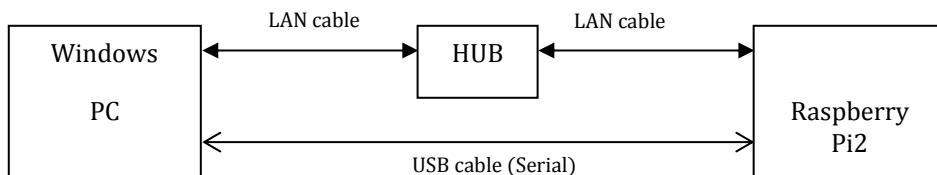

Figure 4-1 Connect the Raspberry Pi2 board and Windows PC

4.3.2 Equipment and Software Used

- (1) LAN cables (straight through)
- (2) USB cable
- (3) Windows PC
- (4) HUB 100 Mbps
- (5) Test programs and data files:

No.	Name	Description	Remarks
1	ttermpro.exe	Terminal software	Windows PC
2	TELNET.EXE	TELNET client program	Windows PC
3	ping.exe	Ping program	Windows PC and Raspberry Pi2
4	qde.exe	QNX Momentics IDE 5.0	Windows PC

4.3.3 Test Items

No.	Major Test Item	Test Outline
1	Verify link connectivity	Execute ping command on the target and Windows PC to verify link connectivity.
2	Connect to target using TELNET	Start the TELNET on the Window PC and make sure that command transmission and data reception are possible.
3	File transmission	Start QNX Momentics IDE 5.0 on the Window PC and make sure that a file can be transferred between Window PC and Raspberry Pi2 board

4.3.4 Test Procedures

- Start QNX Momentics IDE on the Windows PC. Add Raspberry Pi2 to the target list. Use the File System Navigator to copy data to the Windows PC.
- Start Ethernet driver on Raspberry Pi2 target: Make sure the followings were started already at time of starting QNX image by pidin a as below:

```
# pidin a
....
28690 io-pkt-v4 -dsmsc9514 mac=2e990a002e28 -ptcpip
32787 dhcp.client -l10 -d -ien0
36885 devc-pty
36886 inetd
40980 qconn port=8000
```

- To check ip of the board use "ifconfig" command.

4.3.5 Test Link connectivity using ping command

- (1) On Raspberry Pi2 board
+ ping to host with packet size 64 bytes (64=56+8)

```
# ping -h <host IP address> -s 56 -c 5
```

Expected result: successful with 5 packets transmitted, 5 received, 0% packet loss

+ Ex: # ping -h 192.168.1.103 -s 56 -c 5

```
# ping -h 192.168.1.102 -s 56 -c 5
PING 192.168.1.102 (192.168.1.102): 56 data bytes
64 bytes from 192.168.1.102: icmp_seq=0 ttl=128 time=19 ms
64 bytes from 192.168.1.102: icmp_seq=1 ttl=128 time=10 ms
64 bytes from 192.168.1.102: icmp_seq=2 ttl=128 time=16 ms
64 bytes from 192.168.1.102: icmp_seq=3 ttl=128 time=14 ms
64 bytes from 192.168.1.102: icmp_seq=4 ttl=128 time=12 ms
---192.168.1.102 PING Statistics---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 10/14/19 ms    variance = 19 ms^2
t □
```

Figure 4-2 Test ping command on Raspberry Pi2 board

(2) On Windows PC Host

+ ping to board with packet size 64 bytes

```
#ping <board IP address> -l 64 -n 5
```

Expected result: successful with 5 packets transmitted, 5 received, 0% packet loss

+ Ex: # ping 192.168.1.102 -l 64 -n 5

```
bash-3.1$ ping 192.168.1.103 -l 64 -n 5

Pinging 192.168.1.103 with 64 bytes of data:
Reply from 192.168.1.103: bytes=64 time=18ms TTL=255
Reply from 192.168.1.103: bytes=64 time=17ms TTL=255
Reply from 192.168.1.103: bytes=64 time=39ms TTL=255
Reply from 192.168.1.103: bytes=64 time=48ms TTL=255
Reply from 192.168.1.103: bytes=64 time=25ms TTL=255

Ping statistics for 192.168.1.103:
    Packets: Sent = 5, Received = 5, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 17ms, Maximum = 48ms, Average = 29ms
bash-3.1$
```

Figure 4-3 Test ping command on PC

4.3.6 Testing Command Control by a TELNET Client

(1) From command line on Window PC:

- telnet 192.168.1.103 (IP of Raspberry Pi2 Board)

(2) Login message is displayed on the Windows PC.

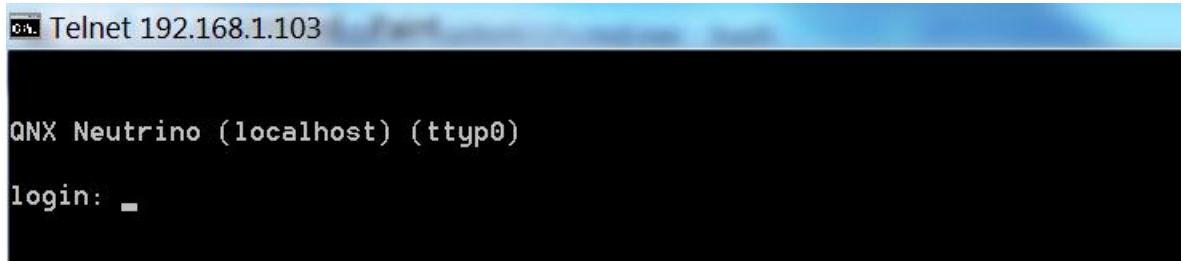

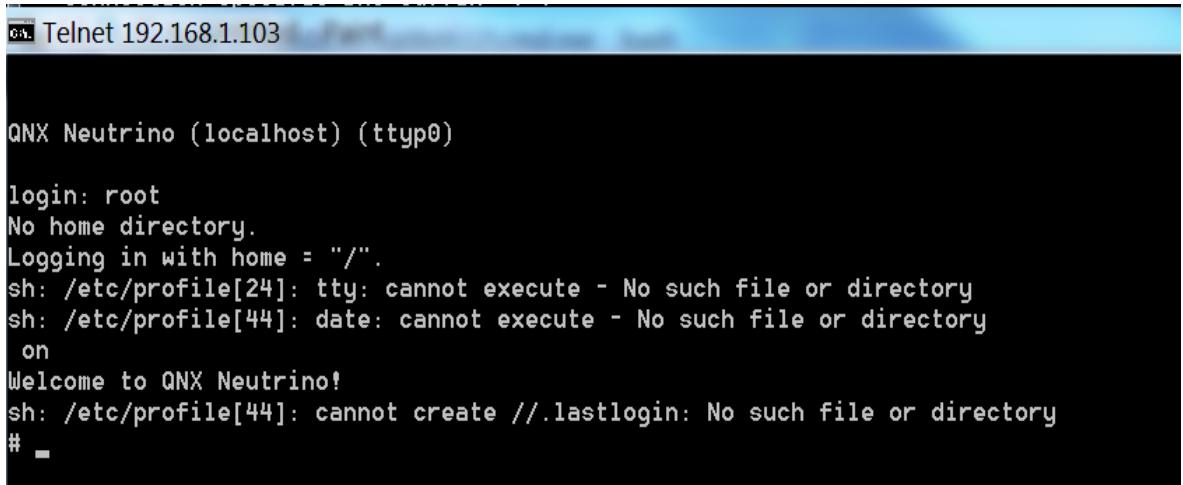

Figure 4-4 Telnet login console

(3) Enter root. You can login to Raspberry Pi2 board

The screenshot shows a Telnet session connected to 192.168.1.103. The terminal window title is "Telnet 192.168.1.103". The log output is as follows:

```
QNX Neutrino (localhost) (ttyp0)

login: root
No home directory.
Logging in with home = "/".
sh: /etc/profile[24]: tty: cannot execute - No such file or directory
sh: /etc/profile[44]: date: cannot execute - No such file or directory
on
Welcome to QNX Neutrino!
sh: /etc/profile[44]: cannot create //lastlogin: No such file or directory
# -
```

Figure 4-5 Raspberry Pi2 QNX 6.6 console

4.3.7 File transmission test between Window PC and Raspberry P2 board

- (1) Start QNX Momentics IDE 5.0 on the Window PC.
- (2) Add Raspberry Pi2 platform to the target list.

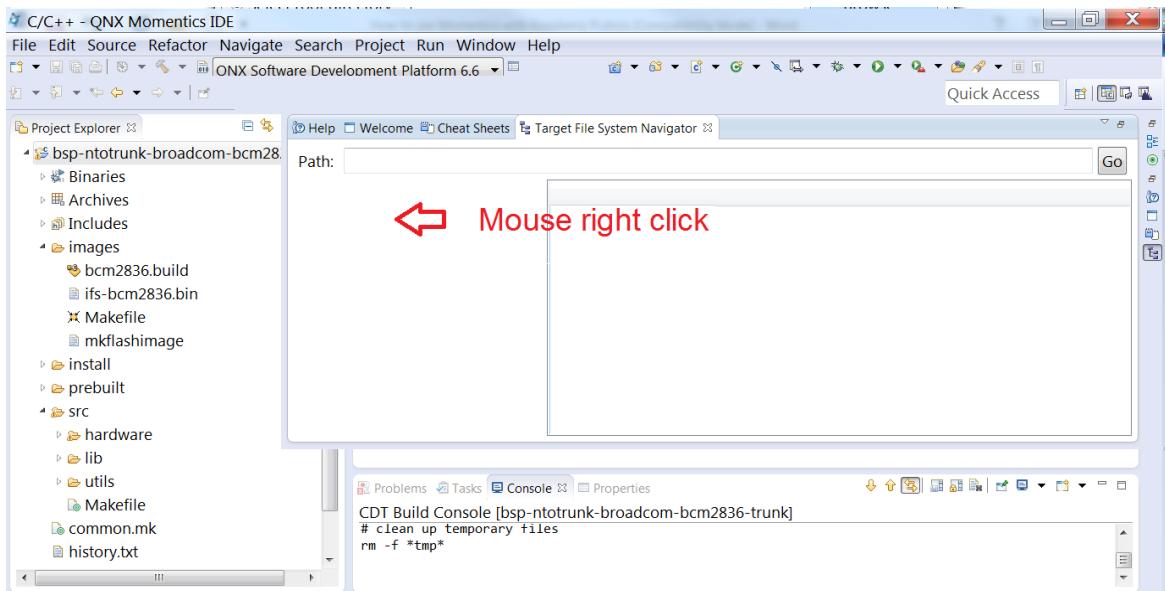

Figure 4.6 Open New QNX target

QNX 6.6.0 Setup Manual for Raspberry Pi2 board

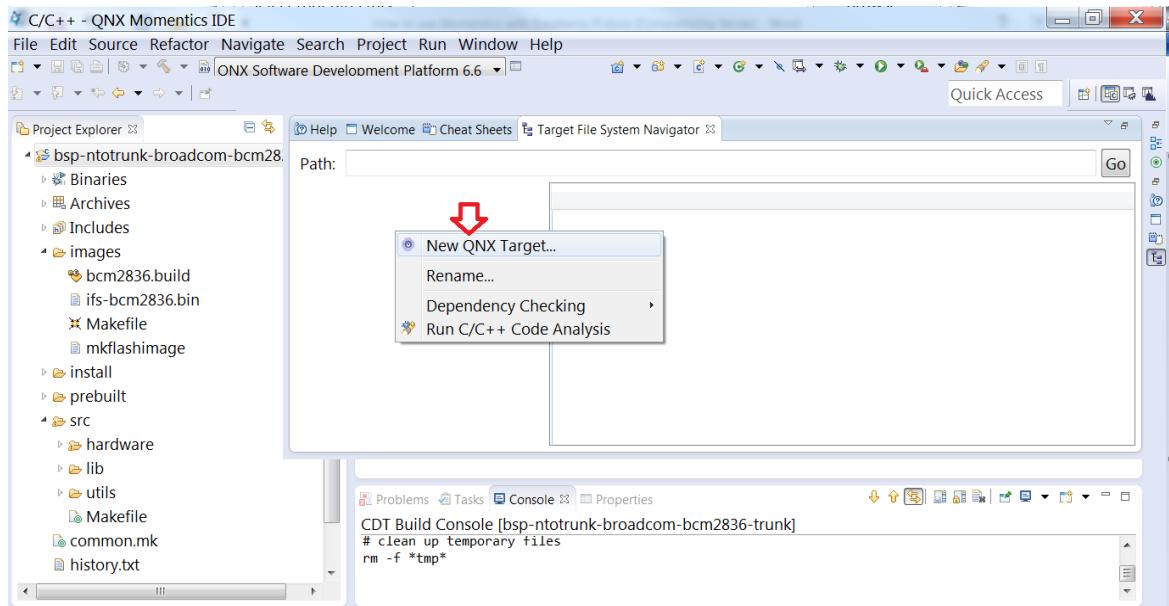

Figure 4.7 Select New QNX target

Enter IP of Raspberry Pi2 platform:

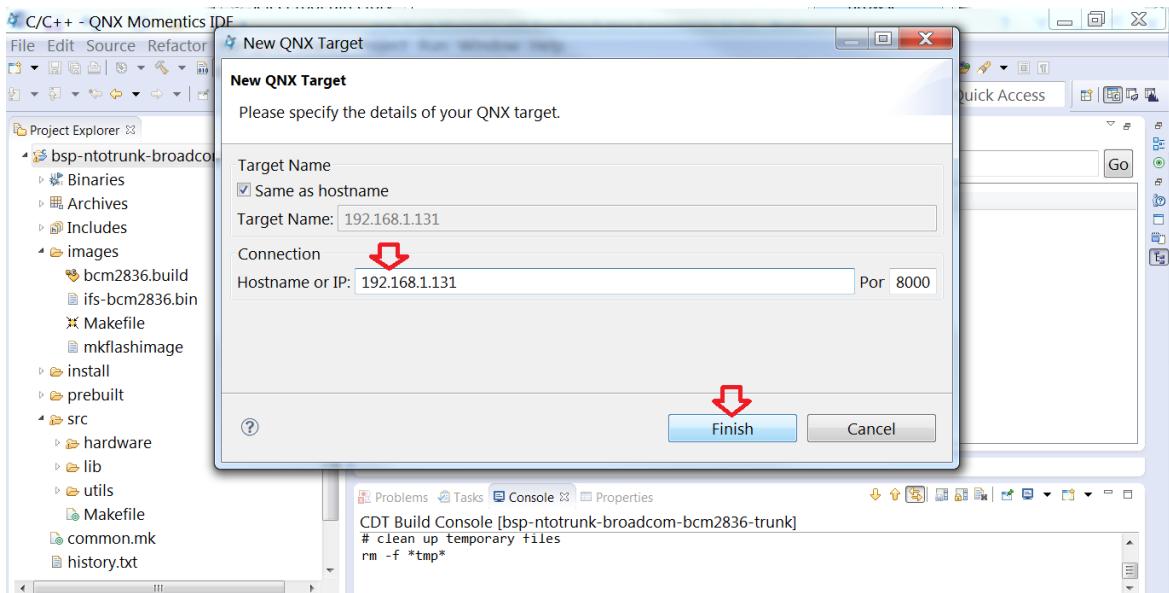

Figure 4.8 Add Raspberry Pi2 QNX 6.6 target

QNX 6.6.0 Setup Manual for Raspberry Pi2 board

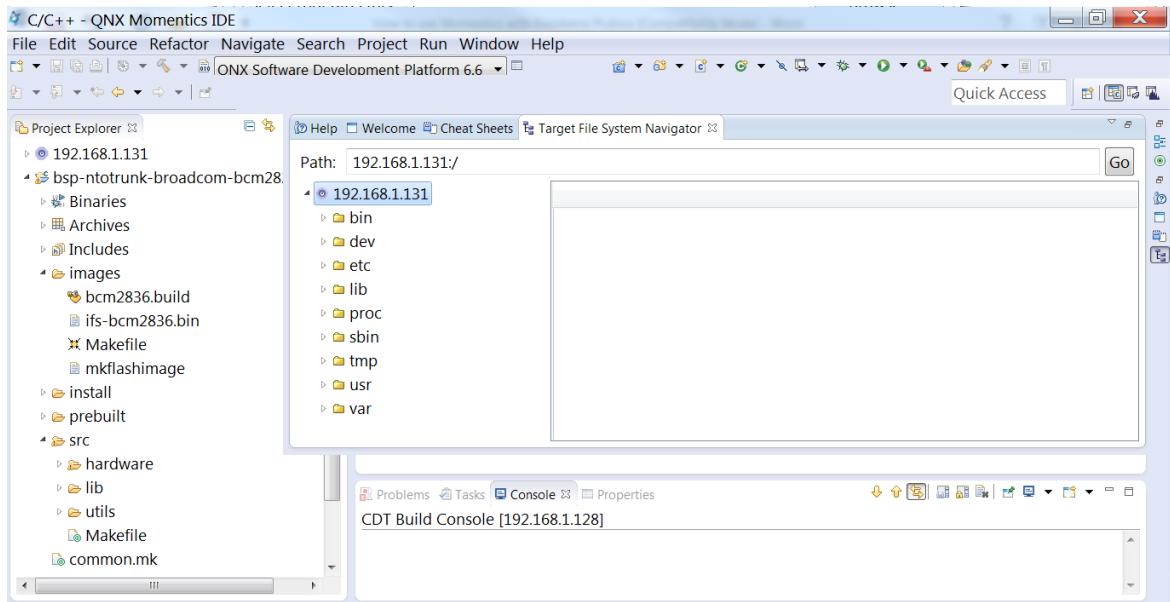

Figure 4.9 Finish adding Raspberry Pi2 QNX 6.6 target

(3) Open /tmp folder

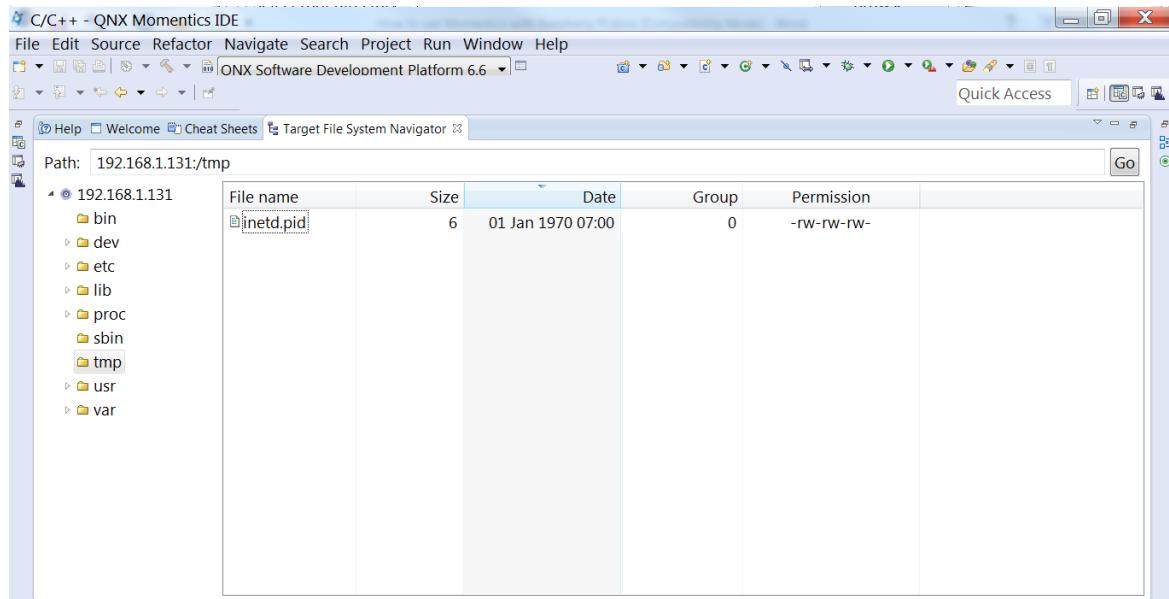

Figure 4.10 Raspberry Pi2 QNX 6.6 target tmp folder list

(4) Copy a file from Windows PC to QNX 6.6 Raspberry Pi2

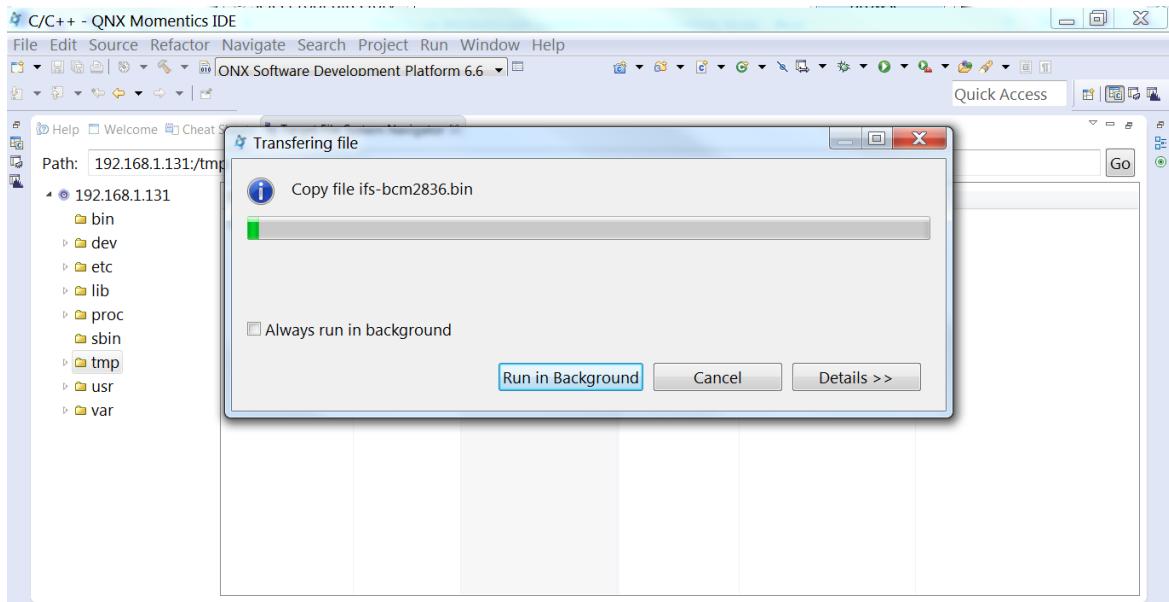

Figure 4.11 Send a files from PC to Raspberry Pi2 QNX 6.6 target

(5) Make sure the size of the target file in /tmp and the source file is match

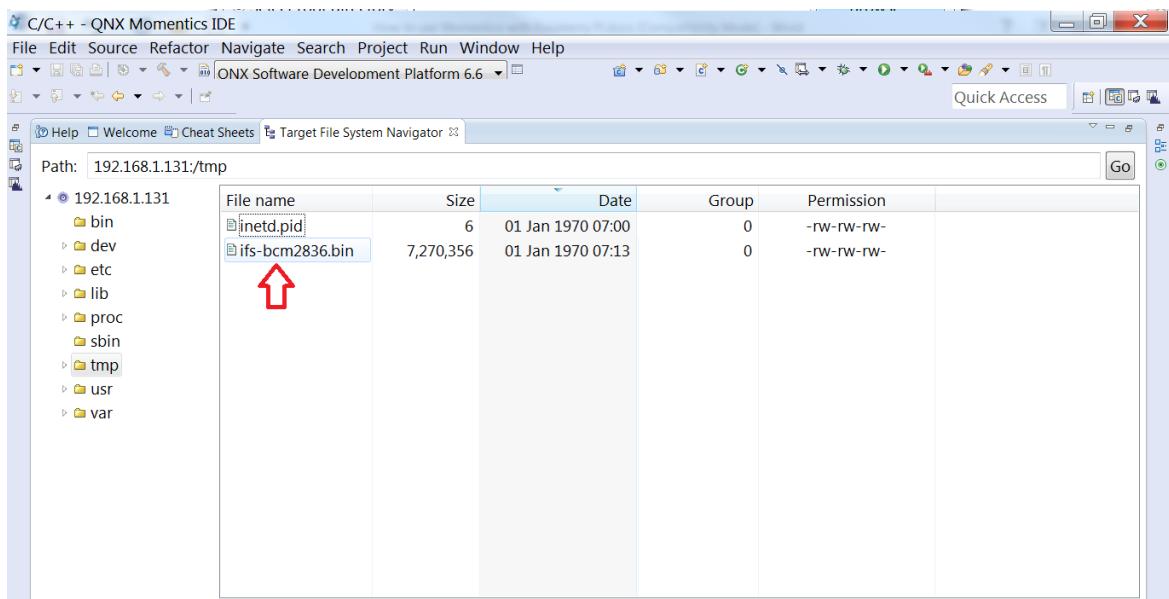

Figure 4.12 Finish sending a files from PC to Raspberry Pi2 QNX 6.6 target

(6) Copy a file from /tmp to window PC.

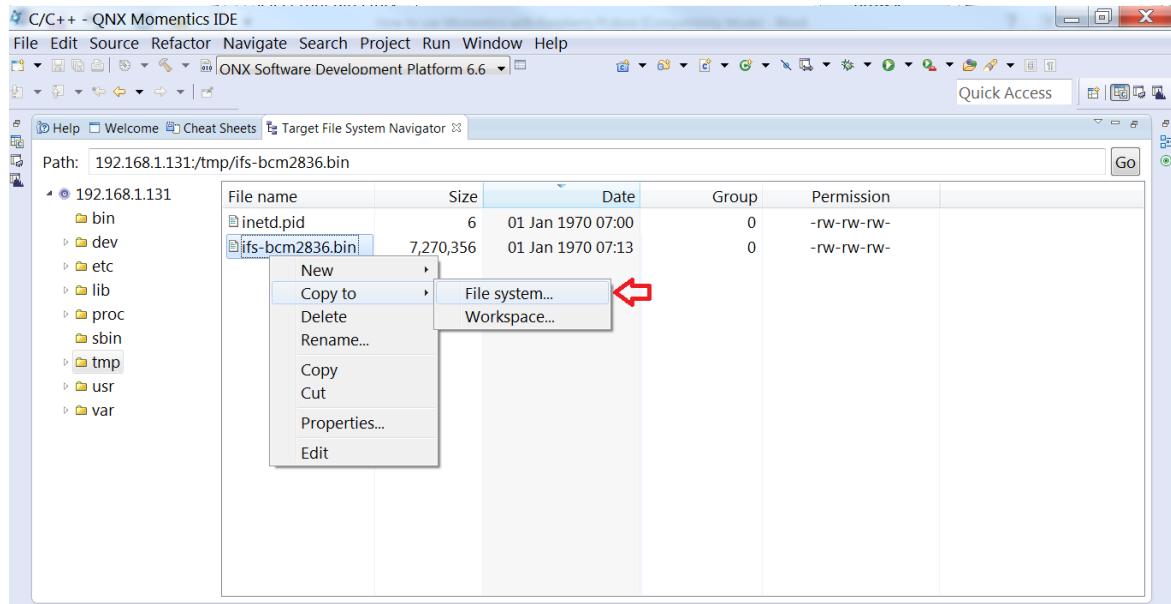

Figure 4.13 Send a files from Raspberry Pi2 QNX 6.6 target to PC

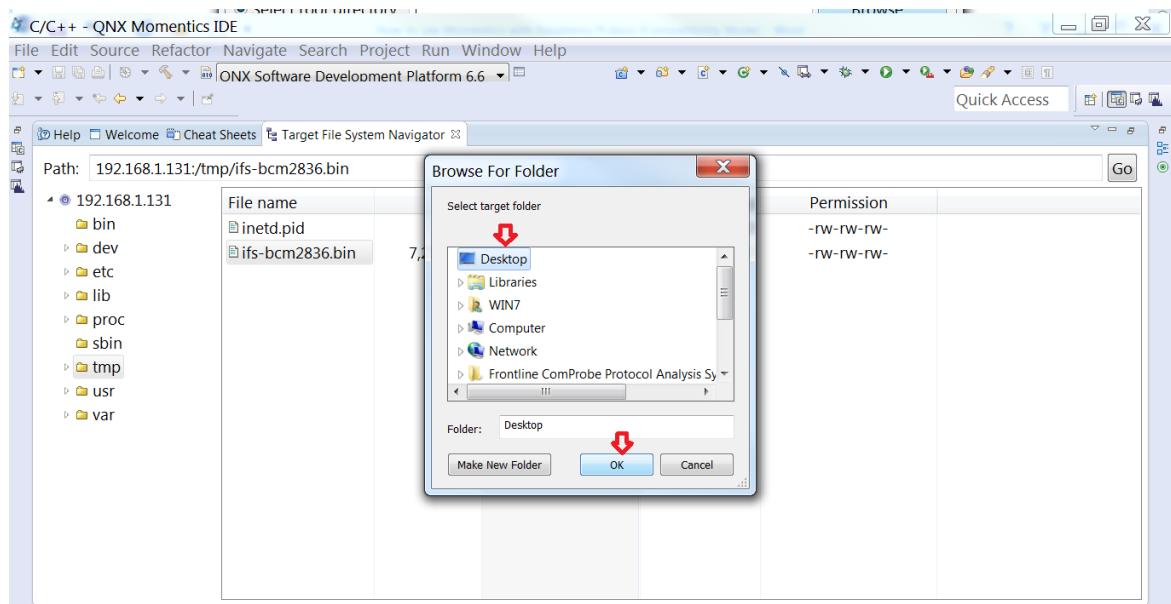

Figure 4.14 Locate file on PC

(7) Make sure the size of the target file in Window PC and source file is match

4.4 SD driver

Notes: Driver isn't supported mode auto detect device insert/remove yet.

Make sure /dev/sd10tX is created in file system by command:

```
RPi2# ls /dev/
```

4.5 Graphics driver

The display driver supports:

- HDMI: Displayed via pipeline 1.

4.5.1 Start/stop the driver

If display driver has not run yet, run it by

```
RPi2#GRAPHICS_ROOT=/usr/lib/graphics/bcm2836
RPi2#LD_LIBRARY_PATH=/usr/lib:/lib:/lib/dll:$LD_LIBRARY_PATH
RPi2#screen &
```

To stop the driver, use “kill <screen process ID>” or “slay screen” then make sure screen process has been terminated.

4.5.2 Display configuration

This section describes how to configure resolution, which display is used, which is main display.

With default setting, HDMI monitor is configured as main display at 800x480.

Display setting is configured by ...\\prebuilt\\armle-v7\\usr\\lib\\graphics\\bcm2836\\graphics.conf. Below is a part of display default setting “graphics.conf”

```

begin display 1
    video-mode = 800 x 480 @ 60
    splash = 0
end display

begin class framebuffer
    display = 1
    pipeline = 1
    format = rgba8888
    usage = sw native

```

The diagram illustrates the configuration settings for display 1. It shows the following components and their relationships:

- Resolution & refresh rate of display 1:** This box contains the setting `video-mode = 800 x 480 @ 60`.
- Display 1 (main display) setting:** This box contains the setting `splash = 0`.
- Framebuffer setting of display 1:** This box contains the setting `display = 1`.
- Default pipeline of display 1:** This box contains the setting `pipeline = 1`.
- Format setting of display 1:** This box contains the setting `format = rgba8888`.
- Usage setting of display 1:** This box contains the setting `usage = sw native`.

The resolution in “graphics.conf” file above is used to allocate frame buffer of Video Core. In order to take effect on real monitor resolution, your display has to support that resolution and “config.txt” in SD card memory needs to be configured too. There are two options to be set:

```
hdmi_group = 2  
hdmi_mode = x (x is the mode of resolution)
```

Refer to config.txt - Raspberry Pi Documentation:

<https://www.raspberrypi.org/documentation/configuration/config-txt.md>

- For example: The resolution in “graphics.conf” file is “video-mode = 1920 x 1080 @ 60”, “config.txt” will be set as follow:

```
hdmi_group = 2  
hdmi_mode = 82
```

- ❖ **Note:** In order to detect HDMI hot plug, place this attribute “hdmi_force_hotplug=1” in “config.txt” file in SD card. This will make Raspberry board appears that a HDMI display is attached. In other words, HDMI output mode will be used, even if no HDMI monitor is detected. In addition, this will solve the problem when Raspberry board is started and there are no display is connected to it. If you connect a display to the board that time, the display will have no input.

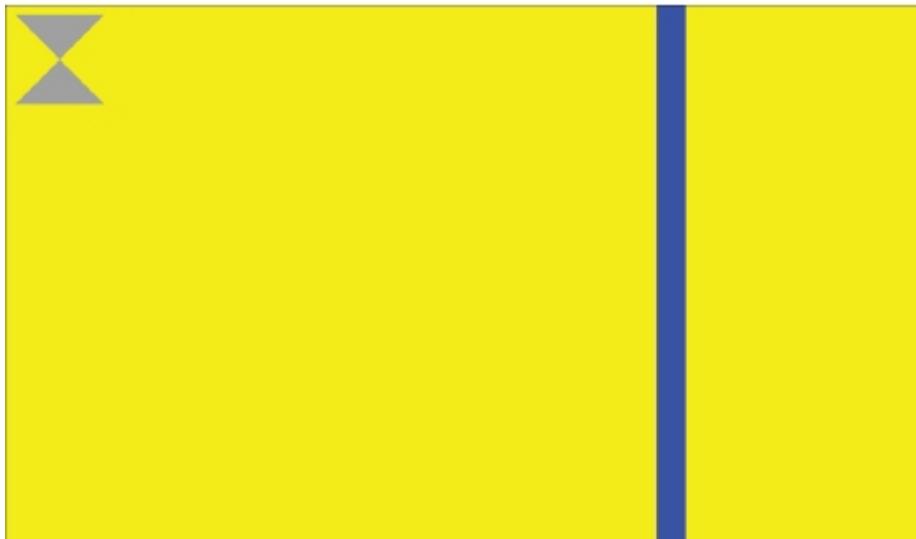

4.5.3 Test driver

- Connect HDMI monitor to port HDMI.
- Make sure that screen has been started.

To test display on HDMI monitor:

- Using “sw-vsync”:

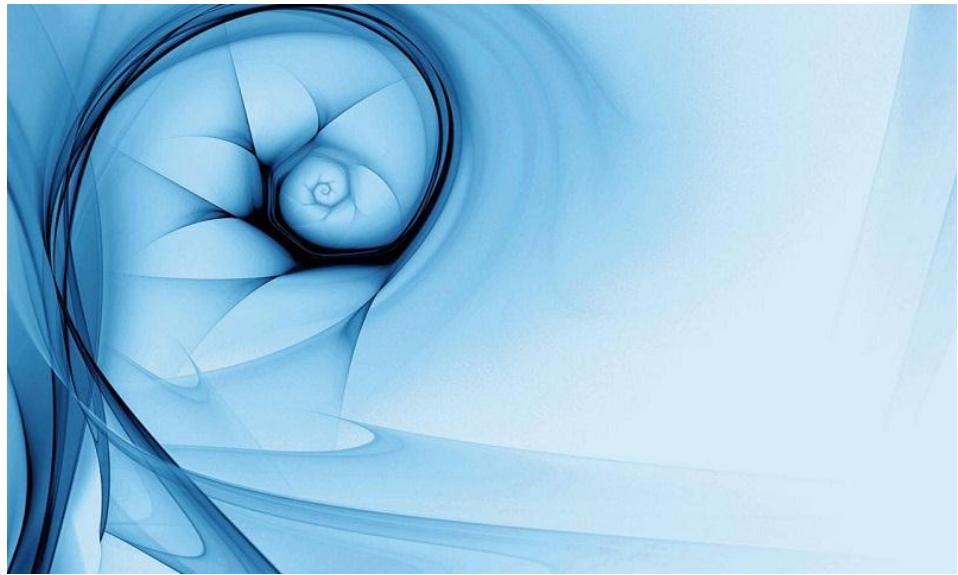

```
RPi2#sw-vsync -size=[width]x[height] &
```

To stop it, use “kill <screen process ID>” or “slay sw-vsync” then make sure screen process has been terminated.

- Using “display_image”:

```
RPi2#display_image -file=/usr/images/[width]x[height]/default.jpg -display=1 -  
pos=[x],[y]
```

To stop the driver, use “kill <screen process ID>” or “slay display_image” then make sure screen process has been terminated.

4.5.4 Configuring driver in source code

Driver developers can configure display driver by modify the driver source code. By that way, they can add more resolutions, allocate different pipelines for each display from default.

4.6 I2C driver

4.6.1 Test Overview

Make sure I2C driver are running with entry point /dev/i2c1

- Connect I2C1 pin on Raspberry Pi2 with HDC1000 I2C device.

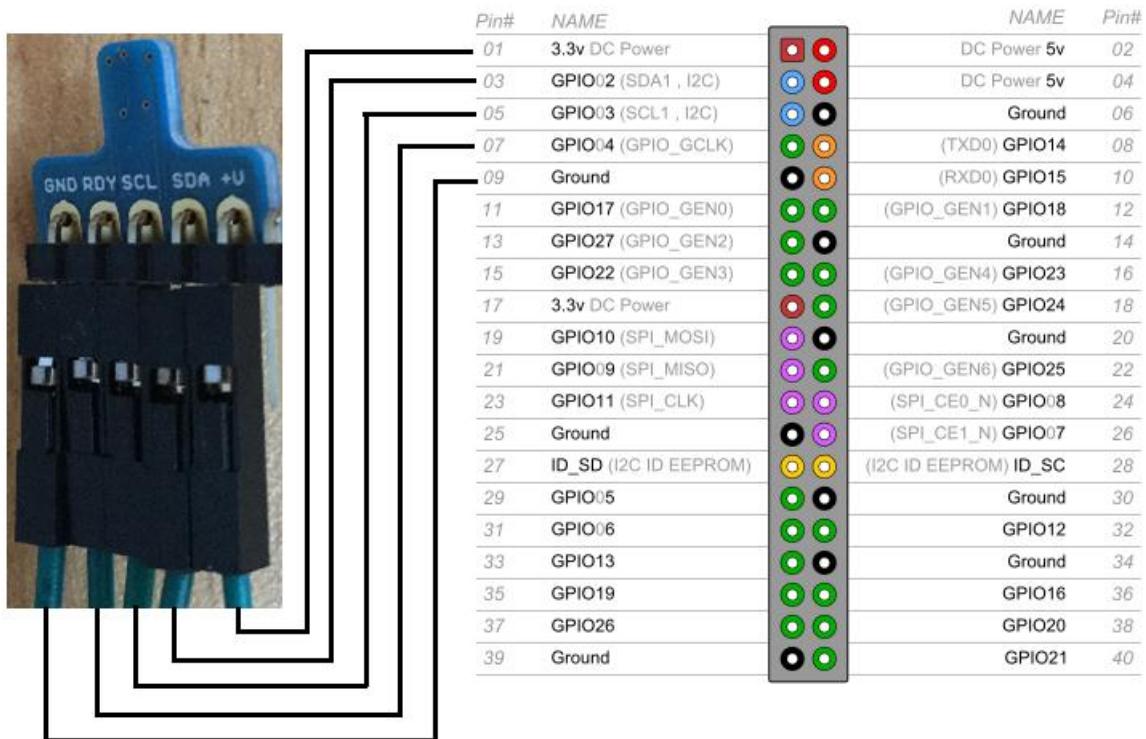

Figure 4-15 Connect I2C1 pin of Raspberry Pi2 with HDC1000

4.6.2 Test Procedures

- Run command as below:

```
RPi2#i2c_test <channel>, <slave>, <speed>
```

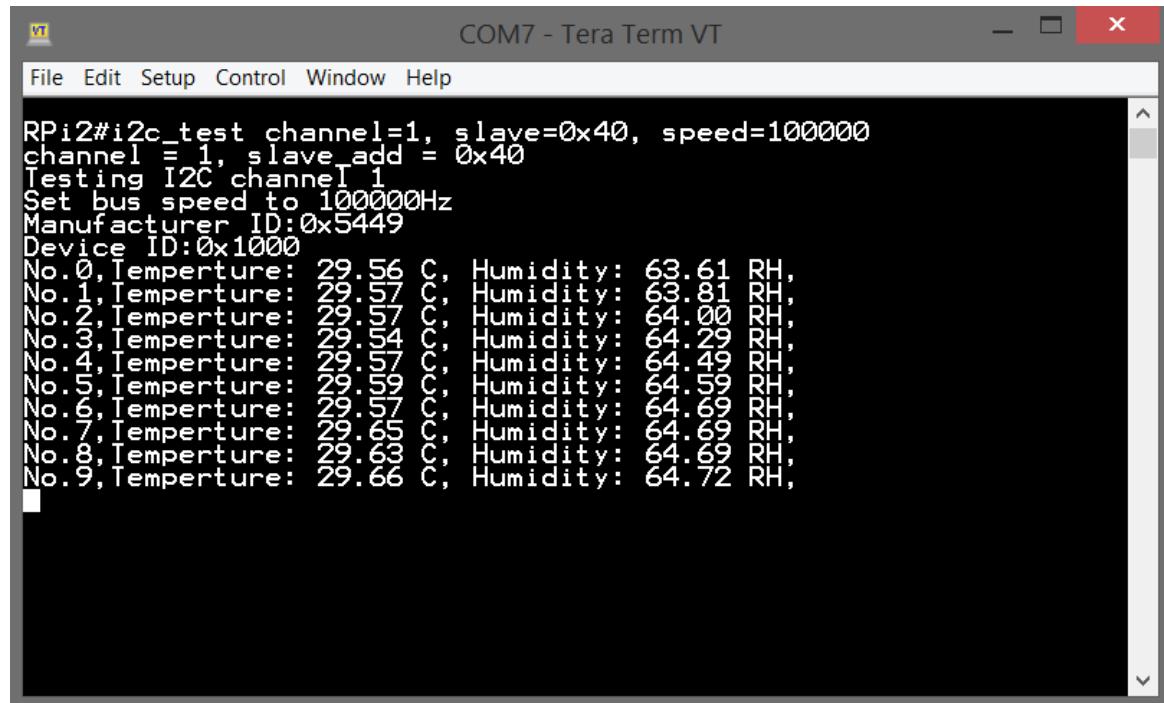

Note: There must be a space after a comma.

4.6.3 Test I2C with HDC1000

- Run command as below:

```
RPi2#i2c_test channel=1, slave=0x40, speed=100000
```

- If the I2C run normally, you can see the result in the terminal as below figure.

The screenshot shows a terminal window titled "COM7 - Tera Term VT". The window has a menu bar with "File", "Edit", "Setup", "Control", "Window", and "Help". The main pane displays the following text output:

```
RPi2#i2c_test channel=1, slave=0x40, speed=100000
channel = 1, slave_add = 0x40
Testing I2C channel 1
Set bus speed to 100000Hz
Manufacturer ID:0x5449
Device ID:0x1000

Figure 4-16 Test I2C1 with HDC1000, speed=100000 and speed=400000

4.7 SPI driver

4.7.1 Test Overview

Make sure SPI driver are running with entry point /dev/spi0

- Connect SPI pin on Raspberry Pi2 with SPI device.

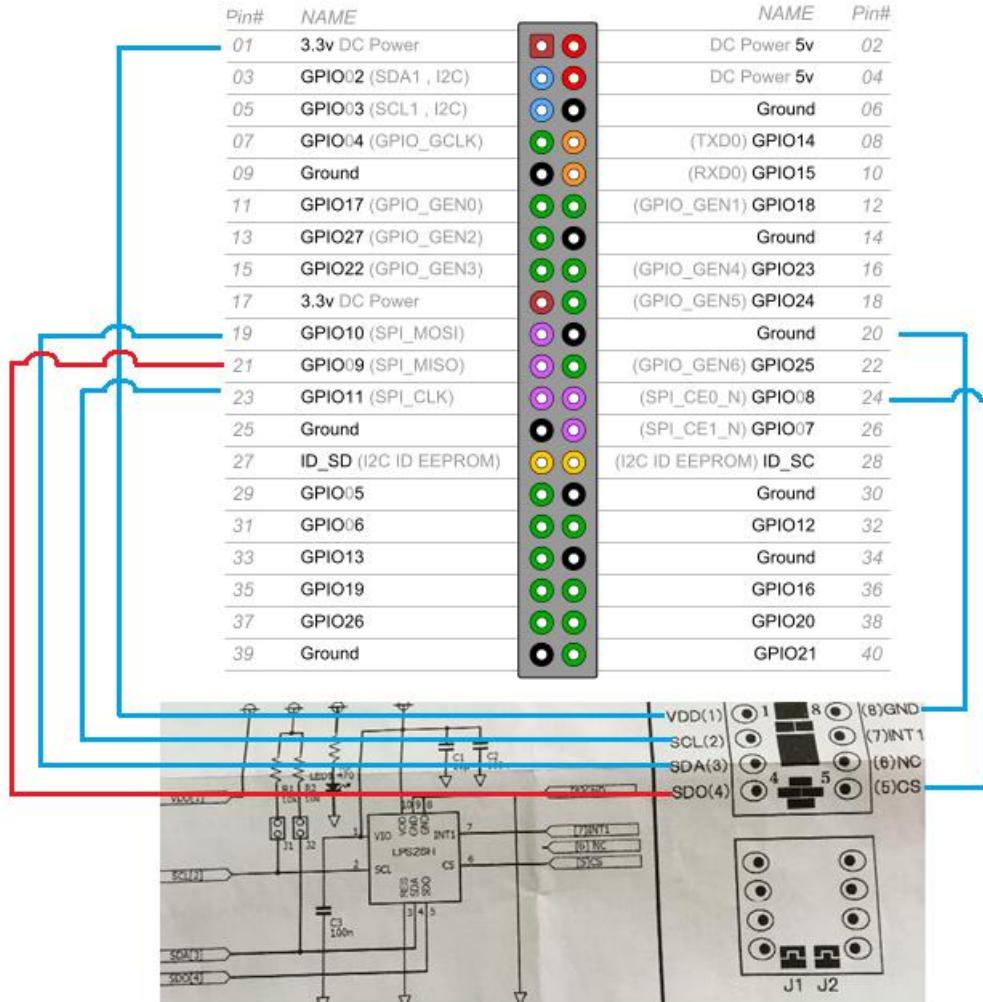

Figure 4-17 Connect SPI pin of Raspberry Pi2 with LPS25H

4.7.2 Test Procedures

- Run command as below:

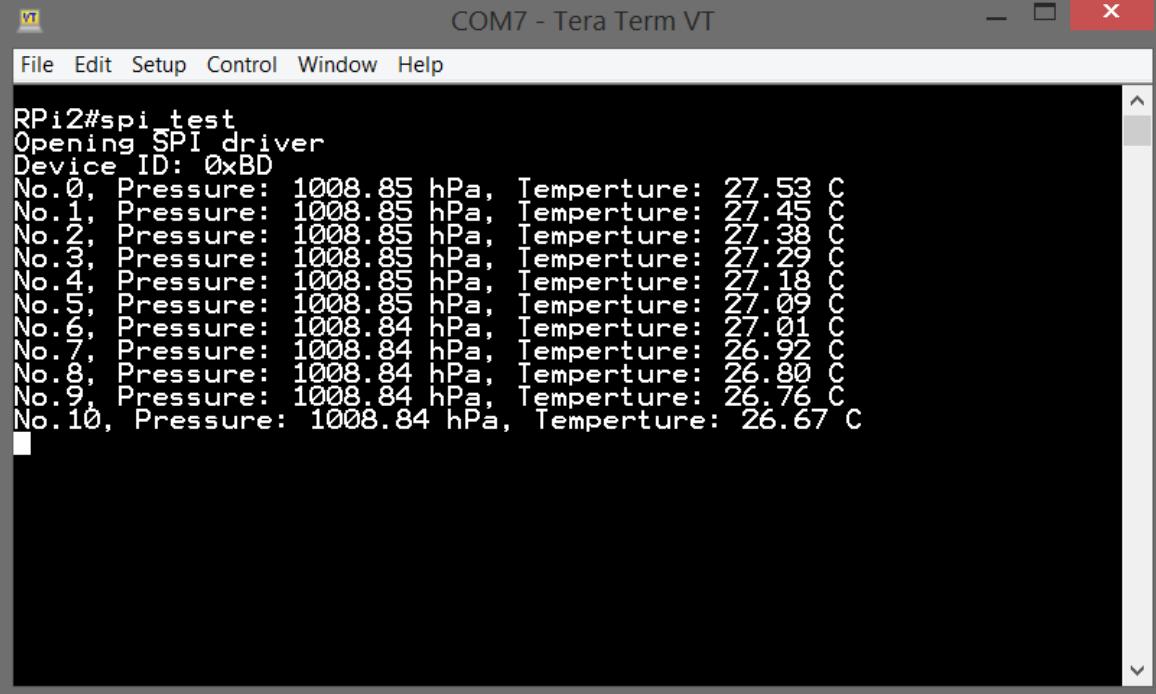

```
RPi2#spi_test
```

4.7.3 Test SPI with LPS25H

- Run command as below:

```
RPi2#spi_test
```

- If the SPI run normally, you can see the result in the terminal as below figure.

The screenshot shows a terminal window titled "COM7 - Tera Term VT". The menu bar includes File, Edit, Setup, Control, Window, and Help. The main window displays the following text output:

```
RPi2#spi test
Opening SPI driver
Device ID: 0xBD
No.0, Pressure: 1008.85 hPa, Temperture: 27.53 C
No.1, Pressure: 1008.85 hPa, Temperture: 27.45 C
No.2, Pressure: 1008.85 hPa, Temperture: 27.38 C
No.3, Pressure: 1008.85 hPa, Temperture: 27.29 C
No.4, Pressure: 1008.85 hPa, Temperture: 27.18 C
No.5, Pressure: 1008.85 hPa, Temperture: 27.09 C
No.6, Pressure: 1008.84 hPa, Temperture: 27.01 C
No.7, Pressure: 1008.84 hPa, Temperture: 26.92 C
No.8, Pressure: 1008.84 hPa, Temperture: 26.80 C
No.9, Pressure: 1008.84 hPa, Temperture: 26.76 C
No.10, Pressure: 1008.84 hPa, Temperture: 26.67 C
```

Figure 4-18 Test SPI with LS25H

4.8 GPIO driver

4.8.1 Test Overview

Make sure GPIO driver are running with entry point /dev/gpio

4.8.2 Test Procedures

- Run command as below:

```
RPi2#gpio_test
```

- If the GPIO run normally, you will see active LED (green LED) on the board blinking and the terminal will show up as below figure

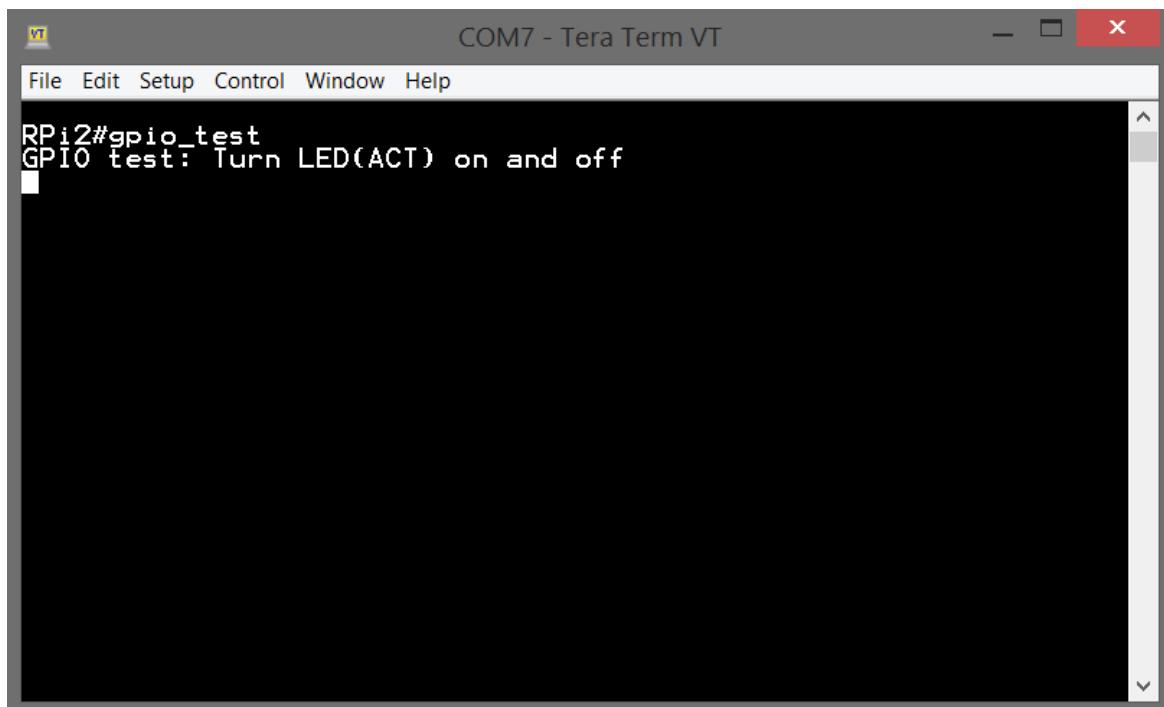

Figure 4-19 Test GPIO

REVISION HISTORY		QNX 6.6.0 Setup Manual For Raspberry Pi2 Board	
Rev.	Date	Description	
		Page	Summary
1.0	September 09, 2016	-	First release
1.1	September 14, 2016	P.7 to P.12	<ul style="list-style-type: none"> - Added 4.2 USB driver - Added 4.3 Network driver
1.2	September 27, 2016	P.13 to P.20	<ul style="list-style-type: none"> - Added 4.4 SD driver - Added 4.5 Graphics driver - Added 4.6 I2C driver - Added 4.7 SPI driver - Added 4.8 GPIO driver
